Awesome!

Today is my last paper, so I will be working on finishing and reviewing it—along with other papers already submitted since I can resubmit—to make sure the work is good.

I will have until the 15th of August to resubmit, so I may be taking some time to briefly review them, but no work is due after today.

Feel free to schedule a chat anytime after today, I can definitely accommodate your schedule. However, I do have a meeting with my advisor on Friday at 1pm that may take about an hour. Any other day/time works for me.

Let me know what works best for you. Looking forward to our chat.

Best,
Piter

Great and thank you for the thoughts/insights. I will make the request to have you as a GA.

When would be a good stopping point for you to chat? I dont want to interrupt your current work.

Thanks
-Dan

Hi Dan,

I apologize for the late reply—I had to finish and submit two papers, and tomorrow is my last one.

First, thank you for the opportunity. After reflecting on how this opportunity could enhance my goals, I'd like to accept the position and move forward.

Second, I want to share my expectations to make sure it works for all. I briefly listened to the quantum path selection paper while doing errands, and I noticed it uses many neural network concepts I am somewhat familiar with and very

interested in. There were also technical aspects that felt less familiar—such as the success-rate/regret metrics and the way success rates were evaluated against expected outcomes—but I am confident that with a thorough read or research, I can fully grasp those nuances.

Third, the more I considered the neural network aspects and the core problem—finding the optimal path even under adversarial interference—the more I saw its potential impact. I realized that this directly connects to my work in big data medical diagnostics, where path optimization and resilience to interference are critical, and even to my teaching practice, where I strive to make cutting-edge concepts more accessible and equitable.

Lastly, I see this as an opportunity to develop knowledge and skills that can position my work at the intersection of breakthrough technologies in computing, healthcare, and education. With the right framing, I believe that AI and quantum computing could not only accelerate complex diagnostic pipelines but also be taught in a way that democratizes understanding, making it more accessible to diverse learners and institutions.

I know this is a long “yes, I accept” answer, but I wanted to share my perspective before joining the team. I put my full effort and dedication into what gives me purpose—and that’s the same commitment I intend to bring to the work. With that said, if you still feel comfortable, feel free to let the SE office know. I am ready to start contributing!

Best,
Piter

Hi Piter, it seems like I need to let the SE office know in the next day or so.

If you’re ok working on a quantum-related project, the position is yours. It would be a quantum/AI-focused project.

Thanks
-Dan

Hi Dan,

Sounds good, I'll get started on it as soon as I wrap up some work I need to finish and submit tomorrow. I should be able to begin working on the summary either tomorrow or the day after, depending on how quickly I get through my other assignment.

And no worries, I completely understand the “(DO NOT USE CHATGPT)” part. After all, you want to see my reasoning, not that of an AI. You can be certain that if I ever use AI, it’s only to help amplify my own voice, not replace it.

Thanks for your quick response and interest — I’m looking forward to the next steps.

Best
Piter

Hi Piter,

The area in quantum is that I am working on focuses on quantum path selection. I'd say to:

1. Read this paper: <https://arxiv.org/pdf/2411.00316>
2. If you're interested, write a 1-2 page summary (DO NOT USE CHATGPT) of the work.

We can then discuss. Sound good?

Thanks

Hi Dan,

Thanks for reaching out!

Yes, I'm actively seeking a GA-ship in SE for the academic year. While I'm not currently registered for a thesis, I've been vigorously preparing to pursue one that feels as essential to me as the air I breathe. The timing is perfect—I'm about to meet with my faculty advisor to finalize this direction. I've intentionally extended my Data Science MS semester so I can continue taking the courses I believe I truly need to pursue my thesis and open a door that should have been opened long ago.

My research centers on integrating equitable bioinformatics (**EQUITAS**) with software engineering methods for diagnostic and fairness-aware AI. That said, I would be lying if I said I don't think about quantum computing every time I work with complex healthcare data—especially RNA. I'm deeply interested in how quantum computing intersects with optimization, machine learning, and reproducible research tooling—particularly for scale-intensive problems like RNA structure prediction and biomarker modeling.

If helpful, I'd be happy to share a one-page thesis sketch outlining:

- **Thesis direction:** equity-aware algorithms and tooling with potential quantum components (e.g., QAOA for structure prediction, quantum kernels for biomarker models)
- **Expected artifacts:** open-source pipeline, fairness dashboards, and comparative benchmarks
- **GA role synergy:** supporting software infrastructure and research dissemination

I'd love to discuss this further—either in person or via Zoom. I live about 10 minutes from campus and can stop by anytime. Coincidentally, I have a meeting tomorrow at 11 AM to finalize my academic planning, as I'm also taking relevant courses at the

University of Rochester. I want to make sure I align everything across semesters as I move toward my thesis.

Looking forward to hearing your response.

Best,
Piter

Hi Piter,

I am wondering if you're still seeing a GA-ship through the SE Department and are pursuing a thesis. Also, are you interested in the field of quantum computing?

Thanks
-Dan
