Ok, I will join in about 5 minutes

No worries, yes, I am awake, I am in the meeting.

Join our Cloud HD Video Meeting
rit.zoom.us

If you're awake and available, we dont need to wait until 8 to chat.

Hi Daniel,

I just wanted to follow up and let you know I never received an invite or details for our meeting this morning. It's already past 7:12 AM, and I'm unsure whether we are meeting virtually or in person.

Please send over the info when you can — if we're meeting in person, I'll need to plan my drive to campus accordingly.

Best,
Piter

Hi Dan,

Due to unforeseen circumstances, I wasn't able to begin until Saturday, so I couldn't send an update earlier. That said, I wanted to get you a quick summary first thing Sunday morning. Below is a link to a clean, ADHD-friendly summary I created (from my messier working notes, which I can provide if needed) to solidify my understanding of the core concepts in Paper 1, along with three-line takeaways for each paper.

I've completed Paper 1 in full, and I've read the abstract, introduction, and conclusion of the iCMAB paper—so my insights on that one are still evolving as I continue into the full text. My approach has been to take meticulous notes not just to track technical details, but to surface bigger-picture design tradeoffs across papers and explore how we might build a hybrid system grounded in the iCMAB process.

Google Doc (summary & 3-line takeaways of papers): [GA - Papers Overview & Implementation Plan - Progress](#)

Planned Integration Roadmap Update

Rather than commit to a fixed implementation before fully digesting the iCMAB paper, I've been cross-comparing it with EXPNeuralUCB to identify complementary strengths and critical gaps. Based on my analysis so far, here are the key insights:

- iCMAB brings sophisticated predictive modeling through evolved RNNs and handles volatile, incomplete environments well, but it lacks explicit adversarial threat modeling and provides no theoretical guarantees.
- EXPNeuralUCB is purpose-built for adversarial resilience with proven regret bounds, but it's purely reactive with no forecasting or temporal awareness.

This suggests a hybrid approach where iCMAB's predictive world model feeds directly into EXPNeuralUCB's attack-aware decision framework, combining temporal intelligence with adversarial robustness. I'm still working through the technical integration points to preserve EXPNeuralUCB's theoretical properties while adapting iCMAB's forecasting to quantum network constraints.

Once I complete a full iCMAB deep dive, I'll share a detailed implementation plan with data requirements, model interfaces, and evaluation protocols.

Best,
Piter

Great! Were you able to read this paper: <https://arxiv.org/pdf/2411.00316>

I am thinking that our next step should be to see about incorporating our "Informed Contextual Multi Armed Bandits" (iCMABs) into the adversarial process that is described in the paper.

By Monday morning, would you have time to:

1. Provide a 3-4 sentence overview of the adversarial paper and the iCMAB paper
2. Put a plan in place to implementing the iCMAB process

We could then chat Monday morning. Is this doable?

Thanks
-Dan

Hi Daniel,

As advised by the student employment office, I am forwarding you the email I got from them.

Let me know if I need to forward it to someone else, or if there is anything else for me to do as part of the paperwork.

Best,
Piter

To: Piter Garcia (RIT Student) <pzg8794@rit.edu>

Hello,

We have reviewed your records and verified that you are eligible to work during the semesters listed below. This email serves as confirmation of your eligibility, and should be shown or forwarded to your supervisor.

Fall 2025

For international students only, your new i20 expires: NA

Thanks,

Student Employment Office
