Hi Dan,

Sorry for the delay in getting back to you.

Quick status update relative to the items you flagged:

- Repo: I shared a copy with Prof. Travis. He replied, and I sent him the link on Slack—so we should hear back soon.
- Data + validation: I validated the evaluation outputs and created a curated validation corpus in our Drive built directly from the framework object states, so results can be checked/reproduced cleanly (not just via post-hoc parsing).
- Figures: Added the key figures (benchmark design and result summaries) into the Overleaf draft so you can comment directly on the visuals as well as the text.
- Testbeds: I paused mid-way to focus on the comparison work, so I still need to wrap up the two testbeds we had in progress. Once those are stable, they'll plug directly into the same validation corpus + reporting pipeline.
- Paper comparisons: The core comparator framing is in place, and the evaluation infrastructure is solid, but the *direct apples-to-apples alignment* to the additional IEEE paper you sent (and the baselines/noise models they compare against) is still in progress. Next step is to (1) add the explicit written comparison in Related Work in their terminology, and (2) map/implement the key baselines/noise models they used so we can report side-by-side comparisons where feasible.
- Scope: I'm keeping the focus on path selection/allocation first (as you suggested) and treating QKD-style evaluation as a later extension once the routing results are locked down.

Even with the holidays, I'm still moving—I'll send you a short update once the two testbeds are wrapped and the written comparison + baseline mapping are in place.

Thanks,
Piter
