**Meeting assets for Piter Garcia (RIT Student)'s Zoom Meeting are ready!****Meeting summary****Quick recap**

In this meeting, Devroop and Piter discussed personal matters and project updates, including a sandbox project and a script that Piter had updated. Piter presented a visualization tool for comparing different models in a stochastic environment and demonstrated its capabilities. They then discussed testing strategies and benchmarking for their routing optimization work, including comparing their approach against various models and papers, and scheduled a follow-up meeting to discuss progress.

Next steps

- Piter: Work on implementing strategies from papers #2 and #7 this weekend, starting with the last one highlighted
- Piter: Look at MATLAB code and translate it to Python using ChatGPT for paper #2
- Piter: Update the paper with new capacities and make wording clearer for XP needle UCB paper references
- Piter: Update notebook with specific test beds for Devroop to experiment with
- Piter: Draft integration of testing strategies into current experimental setup over the weekend
- Piter: Update Devroop by end of weekend even if work is not finished
- Devroop: Look into implementing papers #5 and #8 to see if they can be implemented
- Devroop: Work on translating strategies to their current experimental setup
- Piter: Send calendar invite for Wednesday meeting next week
- Piter: Forward sandbox code email to Devroop again

Summary**Project Updates and Personal Discussions**

Devroop and Piter discussed personal matters, including Piter's recent break and his father's health issues. They also talked about a sandbox project and a script that Piter had updated. Piter mentioned he would push the changes to the sandbox while they were talking. They briefly touched on a basic exam using 3 and 5 horizons with different capacity options.

Model Comparison Visualization Tool

Piter presented a visualization tool for comparing different models in a stochastic environment. He demonstrated how the tool can display results for different scenarios, showing which models performed well and why. The tool provides a breakdown of winner models and their performance across various metrics, including average rewards and gap reduction. Piter mentioned that while the visualization is not the best, it serves as a useful summary of the model comparisons.

Routing Optimization Testing Strategy Review

Piter and Devroop discussed testing strategies and benchmarking for their routing optimization work. They identified several papers to compare against, including Neural Bandit, Quantum BGP, and other models, with a focus on both model-based comparisons and specific testing scenarios. They agreed to aim for a comprehensive analysis showing how their approach beats individual strategies and overall performs better than alternatives by January. Devroop shared links to quantum network codebases and emphasized the importance of implementing learning-based parts in quantum networks.

Testing Strategy Implementation Comparison

Devroop and Piter discussed implementing and comparing testing strategies across different benchmarks. Piter agreed to examine two specific implementations (numbers 2 and 7) and translate MATLAB code to Python, while Devroop would look into implementing numbers 5 and 8. They scheduled a follow-up meeting for Wednesday after 12 noon to discuss progress. Piter committed to working on the project over the weekend and will send updates, even if not completed by the end of the weekend.
