Meeting assets for Piter Garcia (RIT Student)'s Zoom Meeting are ready!

Meeting summary

Quick recap

Piter and Devroop discussed ongoing work related to running experiments and integrating results into a master table for comparison. Piter explained that he was at a dealership getting his car inspected and shared updates on his progress with running jobs and integrating papers into their framework. They discussed the status of various experiments, including Paper 12, which was nearly complete. Piter mentioned that he had pushed some preliminary results to GitHub and would update the master table once all experiments were finished. Devroop encouraged Piter to start putting together the master table while the experiments were running and offered to review the Overleaf documents. They agreed to reconnect once Piter had completed the table and experiments.

Next steps

- Piter: Complete running the experiments for paper 12 and update the master comparison table with the results by end of day.
- Piter: Start putting together the master table with current results and update it as new results (e.g., paper 12) become available.
- Piter: Add settings and configuration details for each paper to the relevant documentation.
- Piter: Send Devroop the link to the Overleaf document (if not already done during meeting).
- Devroop: Start reviewing the paper and provide feedback, especially after the master table is updated.
- Piter: Notify Devroop when the master table is ready for review.
- Devroop: Revisit the need for 1 or 2 more graphs after the master table is integrated (to be addressed later, but noted as a follow-up).

Summary

Car Inspection and Follow-up Plan

Piter and Devroop briefly discussed Piter's situation at a car dealership, where he was getting his car inspected and fixed. They agreed to connect later, as Piter was occupied until 2:30.

VS Code GitHub Integration Progress

Piter completed running jobs by using a VS Code to GitHub integration that allows for remote execution and memory storage. He is currently focusing on paper club jobs and expects to have the table completed by the end of the day. Piter mentioned that a professor had agreed to review the Overleaf documents separately.

Benchmark Results Comparison Table Status

Piter and Devroop discussed the status of a comparison table for benchmark results. Piter explained that they had completed three tests plus the framework's inspiration source, but were missing paper 12. Devroop noted that the table was not yet populated with results.

Cash Bank Experiment Status Update

Piter reported on the status of running experiments with 4 cash banks, mentioning that one allocator is nearly complete and takes about 2 hours to process. Devroop asked Piter to notify him when the experiments are finished so he can work on the master table for making changes. Piter agreed to start compiling the table now and update it once the current experiment closes later today.

GitHub Test Bed Integration Review

Piter demonstrated the GitHub repository containing test bed information and integration papers, explaining that he had pushed some preliminary results and would update the values with end-to-end data. He showed Devroop how to access the configuration report and discussed the integration process for papers 7 and 12, which covered the findings and quick tests conducted. Piter mentioned that he would fix a link path and continue updating the documentation with more detailed results.

Physical Model Settings Discussion

Piter and Devroop discussed the inclusion of settings in the physical model to aid developers in understanding its functionality and default configurations. Piter emphasized the importance of having these settings visible for development purposes and highlighted the integration of allocator comparisons to support future testing and strategy combinations. Piter also mentioned wrapping up the project, noting a delay due to personal health issues.

Health Challenges and Data Analysis

Devroop and Piter discussed Piter's recent health issues, including a chronic stomach condition that affected his ability to exercise and digest food. Despite these challenges, Piter is now working on compiling a master table to compare results from ongoing experiments while the tests are still running. Devroop plans to review the data from the top once Piter completes the master table.

Document Review and Table Update

Devroop and Piter discussed accessing and reviewing a document on Overleaf. Devroop confirmed they had found the link and would start reviewing the paper, noting that once the master table was added, they might need one or two more grafts, which they could revisit later. Piter agreed to add the table and would notify Devroop when it was done.
