Meeting assets for Piter Garcia (RIT Student)'s Zoom Meeting are ready!

Meeting summary

Quick recap

Piter and Devroop discussed technical issues with Zoom and shared meeting links with Professor Dan, focusing on quantum physics configurations and debugging efforts. They reviewed code modifications, testing environments, and the process of incorporating new models into the framework, with Piter providing detailed explanations on how to modify and validate the code. The discussion concluded with plans to update the README file for future collaborators and create a master dataset for efficient data analysis and comparison.

Next steps

- Piter: Complete debugging and validation of paper number 2 test results by tonight
- Piter: Send update to Devroop on paper number 2 results tonight
- Piter: Forward email with code from paper number 1 to Devroop
- Piter: Do a quick scan of adaptive entanglement routing code and provide update on whether it makes sense to incorporate
- Piter: Park adaptive entanglement routing paper for now - don't incorporate yet
- Piter: Focus on integrating paper number 7 and paper number 12 after completing paper number 2
- Piter: Update README file with a new "Contribution" section explaining how to add models, scenarios, and make changes to the codebase
- Piter: Create notebook with tables and images directly from data source for validation
- Devroop: Review images in the paper when he gets a chance and provide feedback
- Piter and Devroop: Collaborate closely on creating a new comparison table across their methods and other papers' methods once all results are available

Summary

Quantum Objects Debugging Discussion

Piter and Devroop discussed technical issues with Zoom and shared a meeting link with Professor Dan. Piter mentioned enjoying his break after the semester ended and working on debugging and

enhancing quantum objects and attack strategies in a test bed. He planned to show Devroop some code, but the transcript ended before he could do so.

Quantum Physics Code Restructuring

Piter discussed restructuring the code to handle quantum physics configurations and multiple noise levels, while also enhancing the random attack strategy with additional parameters. He noted that the pipeline is now running correctly but identified an issue with Oracle calculations that needs to be addressed. Piter plans to validate the logic against the paper's tests and incorporate feedback from Dan before sharing the updated document with Professor Travis for review.

Project Code Sharing and Feedback

Piter shared a new link with Professor Travis highlighting specific sections for feedback. Devroop suggested maintaining a single project with different versions for sharing. Piter mentioned receiving contingent results for paper number 2 by tonight and expected paper number 7 to progress smoothly after. Devroop requested the code repository link for the first paper, but Piter couldn't provide it, stating it wasn't available. Devroop noted that for paper number 5, he had reached out to the authors for a code link but was yet to hear back. For paper number 4, Devroop found a link to adaptive code, which Piter agreed was easy to integrate but needed to verify its relevance to the paper's model before proceeding.

Quantum BGP Code Base Review

Devroop and Piter discussed focusing on two specific code bases related to quantum BGP, as they are the direct implementations of the papers. Piter agreed to complete the current task and provide an update, including a quick scan of the code. Devroop asked about the process of incorporating new models into the testing environment, and Piter explained the framework's requirements, including inheriting from the Base Bandit class and replacing certain components.

Model Modification and Testing Guide

Piter explained to Devroop how to modify a model by replacing the exploratory arm and incorporating new testing environments. He emphasized the importance of using the GCP_main branch in GitHub and creating a configuration object with a quantum allocator. Piter also described how the multi-evaluator knows what to do once the quantum configuration object is passed to it.

Environment Setup and Contribution Guidelines

Piter explained the technical details of a built environment that can be used independently for running multiple experiments, emphasizing that it builds the environment only once to avoid redundancy. Devroop requested that a new section titled "Contribution" be added to the README file to provide guidance on how to modify the code for adding new models or scenarios. Piter agreed to update the README and ensure it is educational and comprehensive for future collaborators. They also discussed the creation of a master dataset to facilitate efficient data analysis and comparison, ensuring accuracy and transparency in their research.
