Hi Dan and Devroop,

Thanks for the feedback, Devroop - your point about the MLCN track vs the quantum workshops at GLOBECOM made me dig deeper into the scopes.

I did a more thorough review of each venue's CFP more carefully and found much better alignment than I initially did. Here's what I found:

1. ACM MobiCom 2026 (A*) - Really Strong Match

CFP Topics That Fit Us:

- Applications of quantum computing, communication, and sensing to mobile and wireless systems
- Interplay of edge computing, wireless networking and AI

CFP Link: <https://www.sigmobile.org/mobicom/2026/cfp.html>

They Actually Accepted a Quantum Paper in 2025:

- X-ResQ: Parallel Reverse Annealing for Quantum Maximum-Likelihood MIMO Detection (Rutgers/Princeton)

My Take:

The quantum communications topic is obvious, but I also realized we hit their "edge computing + wireless + AI" topic since our bandit approach is basically AI/ML for network resource allocation. Plus, they just accepted a quantum paper last year.

2. IEEE ICNP 2026 (B) - This One's Almost Perfect

We Actually Hit Multiple Topics:

- Quantum networking ← obvious one
- Applying AI/ML to improve networks ← our bandit approach
- Routing and load balancing ← literally what we do
- Network algorithms ← our algorithm design
- Next-generation network architectures ← quantum networks

CFP Link: <https://icnp26.cs.ucr.edu/cfp.html>

ICNP 2024 Just Accepted:

- "Efficient Routing on Quantum Networks using Adaptive Clustering" (U Maryland)
- This is basically the same scope as our work!

My Take:

We match at least 5 of their explicit topics. And they literally just accepted a quantum routing paper last year. I think this might be our strongest fit.

3. IEEE GLOBECOM 2026 (B) - Better Than I Thought

SAC Symposium: "Machine Learning for Communications and Networking" (MLCN)

Scope:

"Machine learning is emerging as a transformative enabler for beyond-5G and 6G wireless networks... with the goal of inspiring innovation and enabling robust, adaptive, and efficient next-generation networks."

Why I think We Fit the Scope:

- "Beyond-5G and 6G" = future/next-generation networks (quantum networks are the next frontier beyond current wireless)
- "Robust, adaptive, and efficient" = exactly what our learning-based bandit approach provides
- "Next-generation networks" = quantum networks are next-gen

Topics We Cover:

- "Quantum ML for wireless communications" ← Direct match
- "Multi-agent and model-based reinforcement learning approaches to communications" ← Our bandits (Devroop identified this!)
- "ML for network optimization, resource management" ← Our allocation work
- "Centralized, distributed, and communication-efficient learning for wireless networks" ← Our framework
- "ML for massive connectivity and ultra-reliable and low-latency communications" ← Quantum reliability

CFP Link: https://globecom2026.ieee-globecom.org/sites/default/files/downloads/2025-12/gc-2026-symposium-cfp_sac_mlcn.pdf

Important Note (per Devroop's research):

GLOBECOM also has quantum-focused workshops, but those focus on using quantum computing to enhance classical 6G networks (QKD, quantum-assisted sync, etc.). Our work is different - we're using learning-based approaches FOR quantum network routing. That's why the MLCN track is the perfect fit.

My Take:

Devroop was spot-on in identifying the MLCN track. The symposium explicitly focuses on ML for "beyond-5G" and "next-generation networks" with a goal of enabling "robust, adaptive, and efficient" systems - that's literally what our learning-based quantum routing does. Plus "Quantum ML" is explicitly listed. I strongly believe this is a good fit.

4. ACM IMC 2026 (A) - I Was Wrong About This One

After Re-reading the CFP, We Actually Fit Really Well:

- *Collection and analysis of data that yield new insights about network structure and network performance (e.g., traffic, topology, routing, energy utilization, performance)* ← this is exactly what our framework does
- *Systems and algorithms that build on measurement-based findings* ← our bandits optimize based on measurements
- *Theoretical analysis and modeling of networked-systems and measurement techniques* ← we have this
- *Novel methods for data collection, analysis, and storage* ← our framework is pretty robust at scale
- *Experimental networks, prototype networks, and future internetworks* ← quantum networks qualify

CFP Link: <https://conferences.sigcomm.org/imc/2026/cfp/>

My Take:

I think our framework actually does measurement-based evaluation at a scale that most quantum network work hasn't achieved. We're collecting performance data and yielding new insights about quantum network behavior under different routing strategies. The fact that it's quantum shouldn't matter - they explicitly list "future internetworks." We might be one of the first to do this kind of measurement study for quantum routing at scale.

5. ACM CoNEXT 2026 (A) - Also Better Than I Initially Thought

From Their Website:

- The focus of CoNEXT is around innovative developments on networking technologies
- Their theme is literally: "emerging Networking EXperiments and Technologies"

Topics We Cover:

- "Advanced protocols and services" ← quantum routing protocols
- "Routing" ← core of what we do
- "Machine learning as applied to all layers of networking" ← our approach
- "Internet measurements and modelling" ← our evaluation

CFP Overview: <https://www.sigcomm.org/events/conext-conference>

My Take:

Quantum networks are literally "emerging networking technologies," and our testbed work is definitely "experiments." Their mission statement actually matches what we're doing pretty well.

This is the strategy I think would work well for us based on my thorough review:

Top Tier Venues (All Strong Matches):

1. *IEEE ICNP 2026 (B) - May 15/22*
 - We hit 5+ topics in their CFP
 - They just accepted quantum routing in 2024
 - Probably our cleanest match
2. *IEEE GLOBECOM 2026 (B) - April 1*
 - Quantum ML is explicitly listed
 - The whole symposium is ML + Communications
 - We cover 5+ of their topics
3. *ACM MobiCom 2026 (A*) - March 6/13*
 - Quantum topic explicit
 - Recent quantum acceptance
 - Highest ranking (A*)

Also Good Options:

4. *ACM IMC 2026 (A) - April 22/29*
 - Our measurement framework approach is novel for quantum
 - Could be a first-of-its-kind quantum network measurement study
5. *ACM CoNEXT 2026 (A) - May 29/June 5*
 - "Emerging networking experiments" (our work)
 - Strong systems/testbed focus

Honestly, all five venues look like legitimate options since we hit multiple topics in each one.

Any advice on how we should proceed?

Best,
Piter

Thanks for sending this. Can you review MobiCom and the others to see if they typically accept works related to your research?

This is the only reference that I see for [MobiCon](#):

- Applications of quantum computing, communication and sensing to mobile and wireless systems

Hi Dan,

Following up on our last meeting, here are the US-based venues rated B or higher with deadlines at least a week out.

Venues (B-rated or higher):

-

ACM MobiCom 2026
(A*) – Austin, TX

Abstract due March 6, full paper March 13 (AoE)

<https://sigmobile.org/mobicom/2026/>

- IEEE GLOBECOM 2026
(B) – Location TBD

Paper due April 1, 2026

<https://globecom2026.ieee-globecom.org/>

- ACM IMC 2026 (A)
– US location TBD

Cycle 2: abstract due April 22, full paper April 29

<https://conferences.sigcomm.org/imc/2026/>

- IEEE ICNP 2026 (B)
– Tempe, AZ

Title/abstract due May 15, full paper May 22 (AoE)

<https://icnp26.cs.ucr.edu/>

- ACM CoNEXT 2026 (A)
– Location TBD

June cycle: abstract due May 29, full paper June 5

<https://conferences.sigcomm.org/co-next/2026/>

We can target MobiCom (A*) as our primary submission (March 6/13), with ICNP (B) as a solid backup option if needed (May 15/22). Both have strong alignment with our routing/allocation work.

Please let me know how you would like me to proceed with the 1-2 week submission sprint we discussed.

Thanks again for your guidance.

Best,
Piter
